

# **Ontology as a sense-making technology**

**Riichiro Mizoguchi**

**JAIST:** Japan Advanced Institute of Science and Technology

# What I have been doing

- Ontology (theory)
  1. Theories of roles/functions/objects/processes/events
  2. Building an upper ontology **YAMATO**
- Ontological engineering (practice)
  1. Modeling functional structures of artifacts and its deployment into industry (**SOFAST/OntoloGear**)
  2. Theory-aware authoring tool based on an ontology of learning/instructional theories (**SMARTIES**)
  3. Building a disease ontology and its **publication as a linked data** with links to some existing ontologies
  4. etc.

# Agenda

- Ontology and Ontology Engineering
- Light-weight ontology
  - SW, LD and LOD
    - How to build an ontology
      - Top-down vs. Bottom-up
    - Metadata, RDF, OWL
  - Linked Jazz (an LOD)
  - Open vocabularies
    - Dublin core, FOAF, LOV, Schema.org
    - Knowledge Graph
- Heavy-weight ontology
  - A case in a medical ontology

# Cultural difference?

- Some say “Ontologies depend on culture”
- But, I believe although vocabularies are culturally different, meaning is not
- A good example of “a false friend” of Japan and China

# 手 紙

- Japan and China share Kanji letters
- 手 means “hand” and 紙 means “paper” in both
- But, the meanings of 手紙 are very different
- In Japan, it means “a letter” but “??” in China
- Imagine a couple of a Japanese boy and a Chinese girl, and he asks her “Send me your 手紙”
- She got angry!! Why?

# What is an ontology?

- In philosophy: “Theory of being”
- An ontology is an explicit specification of entities and relations in the target world intended to share within a community and **to use for building a model of the target world**

It usually specifies

- **HOW you VIEW the WORLD**

# An example

## Ontology of vehicle

---

### A simple ontology

#### Vehicle

- ground vehicle
  - motor car
    - 4 or more wheel car
      - car
      - truck
    - motor bike
  - train
- ship
- air craft

### An ontology of vehicle

#### • Vehicle world

- Vehicle
  - ground vehicle
  - ship
  - air craft
- function
  - to carry persons
  - to carry freights
- attribute
  - power
  - size
- component
  - engine
  - body
- traffic system
- ...

# Ontology (Engineering) as Content Technology

- It enables you

- to **do consistent** knowledge representation
  - by giving you an explicit viewpoint/guideline
  - Without consistency, computers cannot deal with knowledge properly
- to **share/reuse** knowledge across various domains
- to make pieces of knowledge **interoperable**
- to build **ontology-aware** intelligent systems

# Kinds of ontologies (not exhaustive)

- Upper ontology (Top-level ontology)
  - *DOLCE, BFO, UFO, YAMATO, etc.*
- Domain ontology
  - *Disease ontology, Gene ontology, etc.*
- Task ontology (coined by myself)
  - *Ontology of design, ontology of diagnosis, etc.*
- A system of vocabulary
  - *FOAF, Dublin core, etc.*

# Dichotomy of ontology

- **Light-weight** Ontology
  - Something like FOAF, Dublin core, etc.
  - **Vocabulary** rather than concepts
  - Annotation-oriented ontology
  - Used as metadata for information search
  - **Practice-oriented**
- **Heavy-weight** Ontology
  - Something like an upper ontology
  - **Concepts** rather than vocabulary
  - for understanding the target world
  - for making what is left implicit explicit
  - for building ontology-aware system
  - **Philosophy-oriented**

# Use/building of Ontology

**Bottom-up**

**vs.**

**Top-down**

# Two approaches

- **Bottom-up approach (Light-weight ontology)**

- Policy
  - Distributed control (No centralized control)
- Utilize existing various resources
  - How to find them?
- Metadata
  - How to understand metadata?
- Ontologies
  - How to make ontologies interoperate?
- Ontology alignment

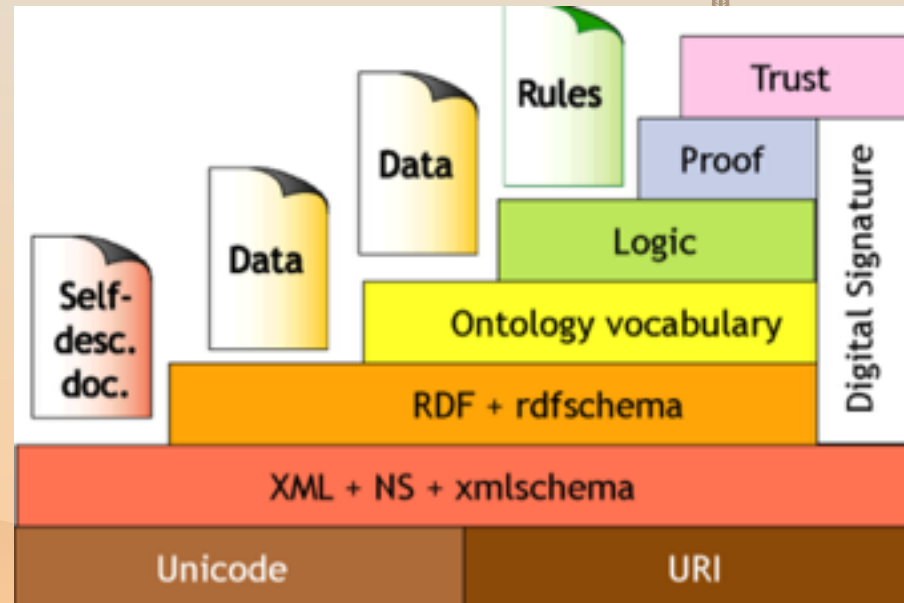

- **Top-down approach (Heavy-weight ontology)**

- Policy
  - Try to model the target world with a sophisticated ontology
- FOIS conferences, Journal of Applied Ontology

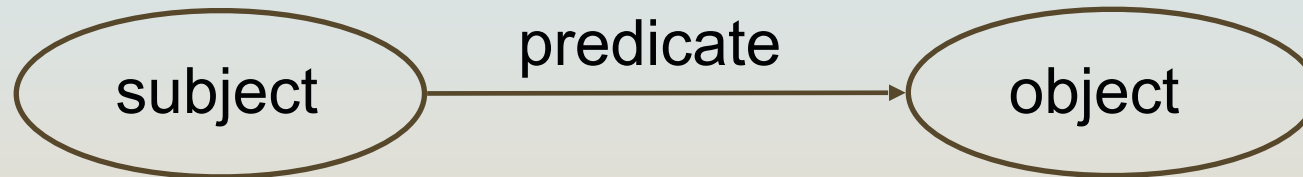

# The Semantic Web

- Metadata needs ontology to make sense of them
- HTML-based Web
  - Links have **no semantics**, and they just allow you to jump to the specified page
- RDF-based Web including LD/LOD is different
- Links have **meanings** such as *is-member-of*, *is-capital-of*, *manufactured-by*, etc.

Copied from @W3C

# RDF (Resource Description Framework)

```
<rdf:RDF
  xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:dc="http://purl.org/dc/elements/1.1/">
  <rdf:Description rdf:about="http://en.wikipedia.org/wiki/Tony_Benn">
    <dc:title>Tony Benn</dc:title>
    <dc:publisher>Wikipedia</dc:publisher>
  </rdf:Description>
</rdf:RDF>
```

URI

URI

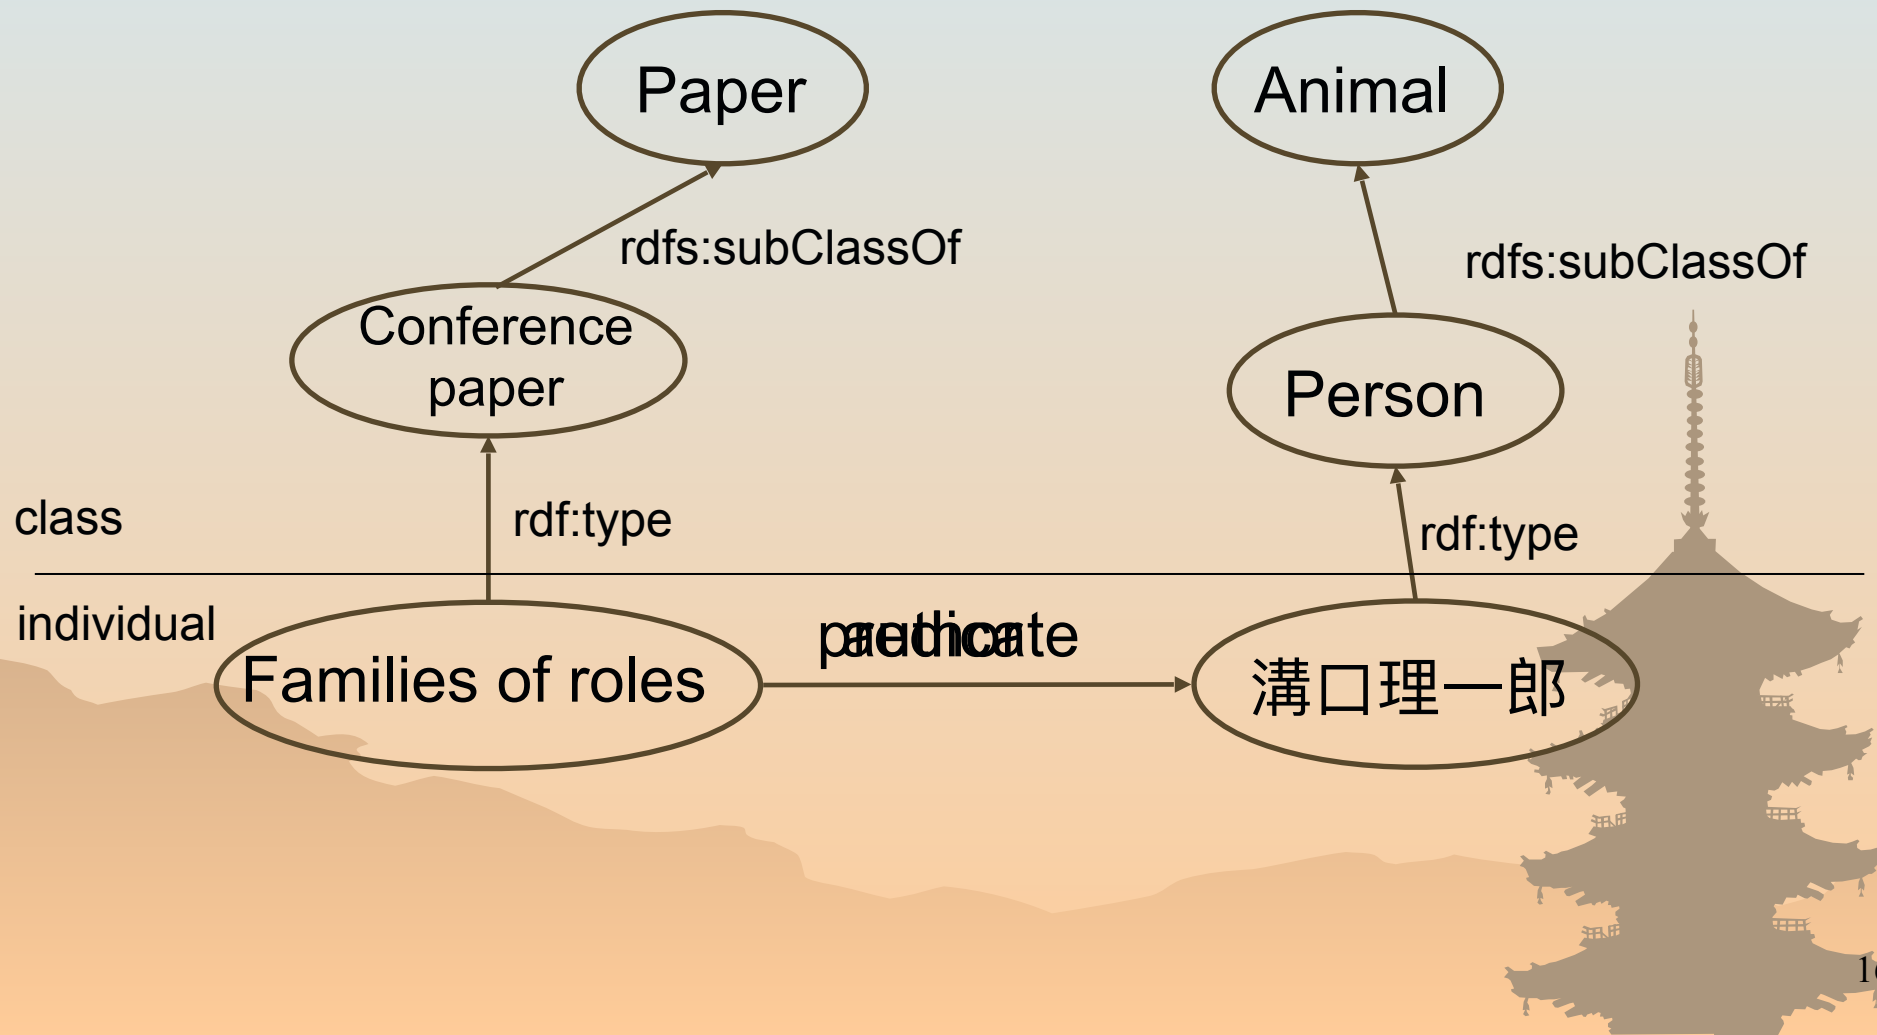

# What is sense-making?

- Ontology plays a role of sense-making technique for semantic processing by giving “meaning” of terms used in SW/LD/LOD
  1. Identification of the ***type/class*** of the **individual** under consideration
  2. Identification of ***is-a*** hierarchy of those types/classes
  3. An upper ontology can explain what exist out there

# An example of sense-making

# LD/LOD

- Linked Data is about using the Web to **connect related data** that wasn't previously linked, or using the Web to lower the barriers to linking data currently linked using other methods. More specifically, Wikipedia defines Linked Data as "a term used to describe a recommended best practice for exposing, sharing, and connecting pieces of data, information, and knowledge on the Semantic Web **using URIs and RDF**"
- **Excerpt from** <http://linkeddata.org/>

# Four conditions

1. Use **URIs** as names for things
2. Use HTTP URIs so that people can look up those names.
3. When someone looks up a URI, provide **useful information**, using the standards (**RDF**, **SPARQL**)
4. Include links to other URIs so that they can discover more things

*What data are there must be understood by computer, which is enabled by **SPARQL endpoint** supported by an ontology*

# SPARQL

- Query language for RDF

```
SELECT ?s/p/v  
WHERE {  
  ?s ?p ?v .  
}
```

Graph pattern

```
SELECT ?title  
WHERE {  
  <http://example.org/book/book1> <http://purl.org/dc/elements/1.1/title> ?title .  
}
```

# Google Knowledge Graph

derived from many sources, including  
the CIA World *Factbook*, *Wikidata*, and *Wikipedia*

## 1. Find the right thing

**[Taj Mahal]:** *a monument in India, a musician, casino in Atlantic City, etc.*

It contains **500 M** objects, as well as more than **3.5 B** facts

## 2. Get the best summary

## 3. Go deeper and broader

# Schema.org

- **Schema.org** is a collaborative, community activity with a mission to create, maintain, and promote **schemas** for structured data on the Internet, on web pages, in email messages, and beyond
- Over **10 M** sites use **Schema.org** to markup their web pages
- Essentially, a set of **vocabulary** for metadata of web sites

# schema.org types

- Creative works:  
*CreativeWork, Book, Movie, MusicRecording, Recipe, TVSeries ...*
- Embedded non-text objects:  
*AudioObject, ImageObject, VideoObject*
- *Event*
- *Organization*
- ***Person***
- *Place, LocalBusiness, Restaurant ...*
- *Product, Offer, AggregateOffer*
- *Review, AggregateRating*

# Properties of Person

## (not exhaustive)

Property	Expected Type	Description
Properties from <b>Person</b>		
<b>additionalName</b>	<b>Text</b>	An additional name for a Person, can be used for a middle name.
<b>address</b>	<b>PostalAddress</b> or <b>Text</b>	Physical address of the item.
<b>affiliation</b>	<b>Organization</b>	An organization that this person is affiliated with. For example, a school/ university, a club, or a team.
<b>alumniOf</b>	<b>EducationalOrganization</b> or <b>Organization</b>	An organization that the person is an alumni of. Inverse property: <b>alumni</b> .
<b>award</b>	<b>Text</b>	An award won by or for this item. Supersedes <b>awards</b> .
<b>birthDate</b>	<b>Date</b>	Date of birth.
<b>birthPlace</b>	<b>Place</b>	The place where the person was born.
<b>brand</b>	<b>Brand</b> or <b>Organization</b>	The brand(s) associated with a product or service, or the brand(s) maintained by an organization or business person.
<b>children</b>	<b>Person</b>	A child of the person.
<b>colleague</b>	<b>Person</b> or <b>URL</b>	A colleague of the person. Supersedes <b>colleagues</b> .

# Summary of what we have discussed thus far

- Ontology is necessary for LD/LOD
- It helps you to **make sense of data** in it
- A lot of vocabularies are available
  - You reuse what you need among them
- You don't need heavy-weight ontology
- **Really?**
- **Of course, NOT!**

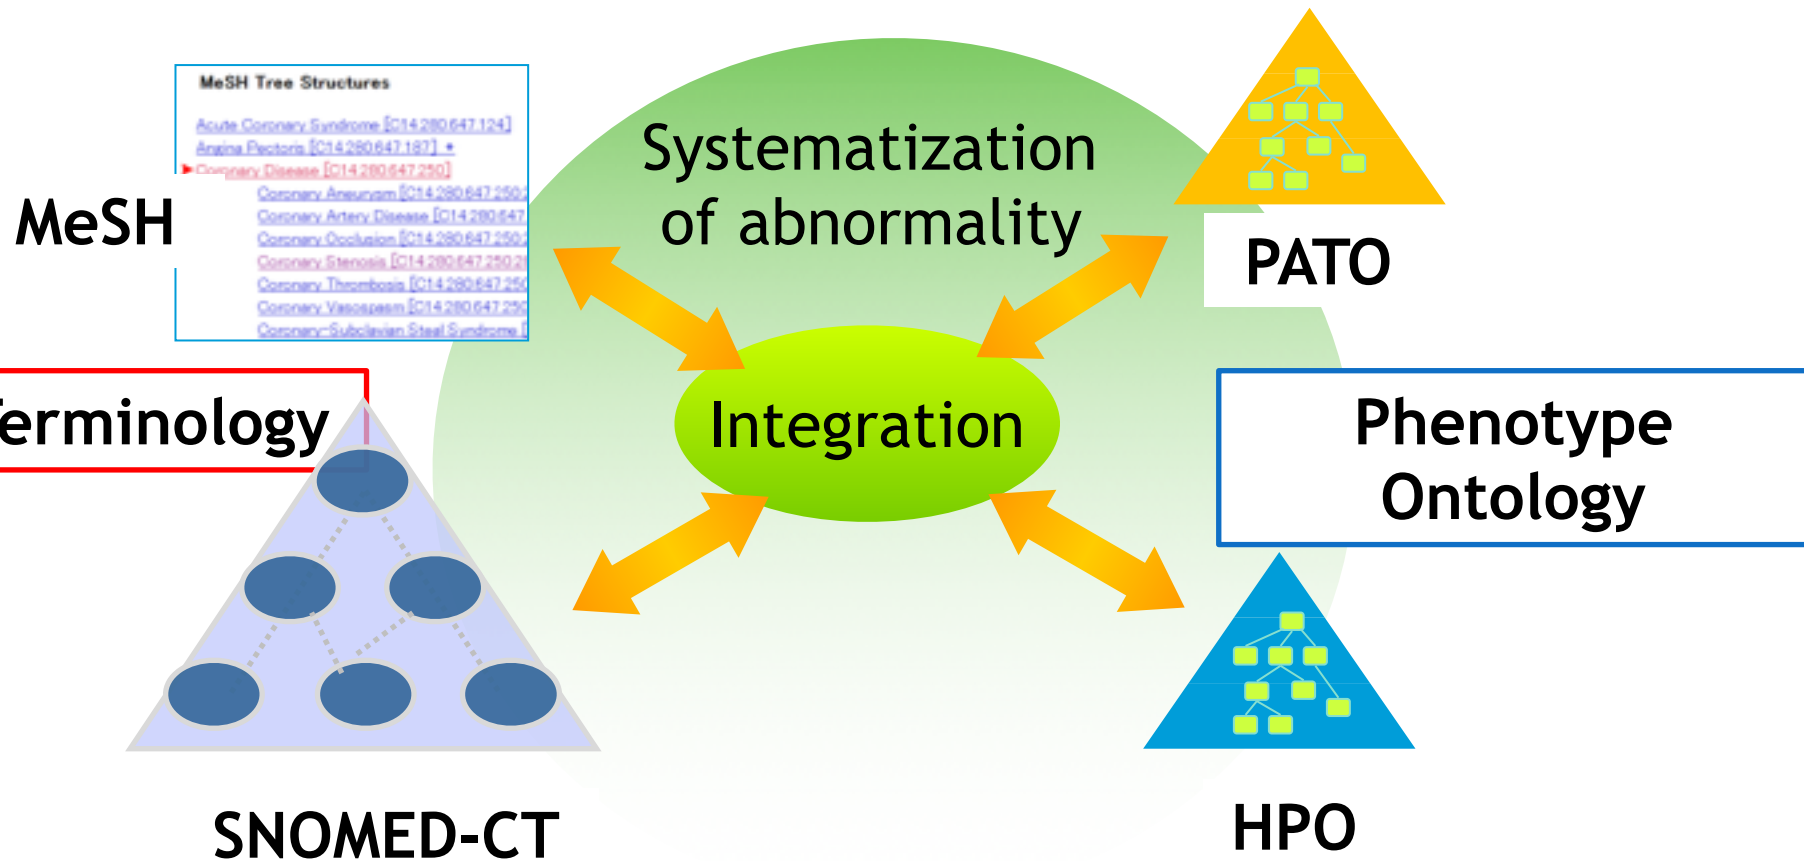

# A case of a medical ontology

- On the WWW, several medical ontologies exist
- They are based on their own upper ontology
  - N o t interoperable
- For example, abnormal states and diseases are considered as belonging to the same category, say, disorder, which causes serious problems

# Linking existing resources via ontology of abnormal states

# Existing resources

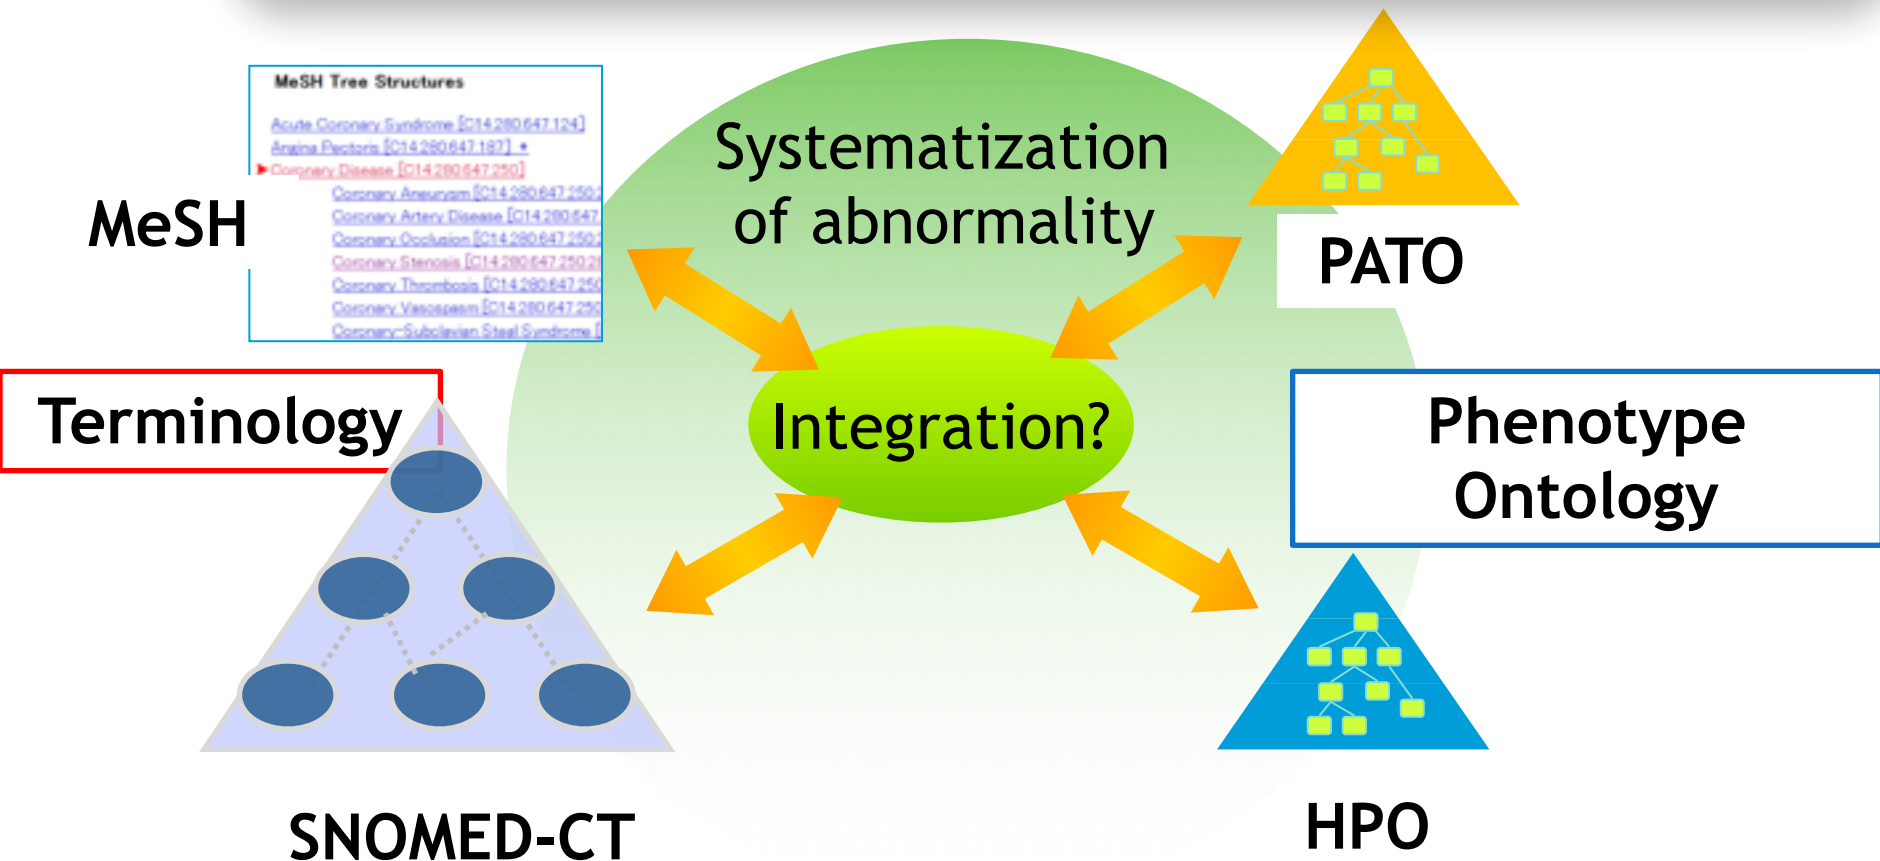

- p **SNOMED-CT** (Systematized Nomenclature Of Medicine–Clinical Terms)
  - p Multiple inheritance
  - p Abnormal states are mixed up with diseases
- p **MeSH** (Medical Subject Headings)
  - p Multiple inheritance
  - p Abnormal state is subsumed by disease class
- p **PATO** (Phenotypic Quality Ontology)
  - p Multiple inheritance
  - p Property-oriented <E,P>, not compatible with <E,A,V>
- p **HPO** (Human Phenotype Ontology)
  - p Organized according to the body structure
  - p Abnormal states are
  - p No attribute values

正しいis-aもありますので、misuse of is-a relation などにとどめておくほうがよいかとも思いました。

# Issues of integration

1. Granularity of concepts to be linked
2. Abnormal states are mixed up with diseases
3. Incompatibility between property-orientated <E,P> and Attribute-orientated <E,A,V> representation

# Sense making of...

- p State vs. Property
- p Property vs. Attribute
- p Disease
  - p abnormal state vs. disposition vs. causal chain

# Property and State

”A state is a time-indexed property”

## Tall and hungry

- p John is tall
  - p John possesses tall property which inheres in John
- p John is hungry
  - p John is in a hungry state in which John participates (at time t)
- p  $\langle \text{John, tall} \rangle = \langle \text{John, height, large} \rangle$ 
  - $\langle E, P \rangle \qquad \qquad \langle E, A, V \rangle$
  - p tall =  $\langle \text{height, large} \rangle$
  - p Property =  $\langle \text{Attribute, Value} \rangle$
- p  $\langle \text{John, hungry} \rangle = \langle \text{John, (degree of) hunger, large} \rangle$ 
  - p Hungry =  $\langle (\text{degree of}) \text{hunger, large} \rangle$

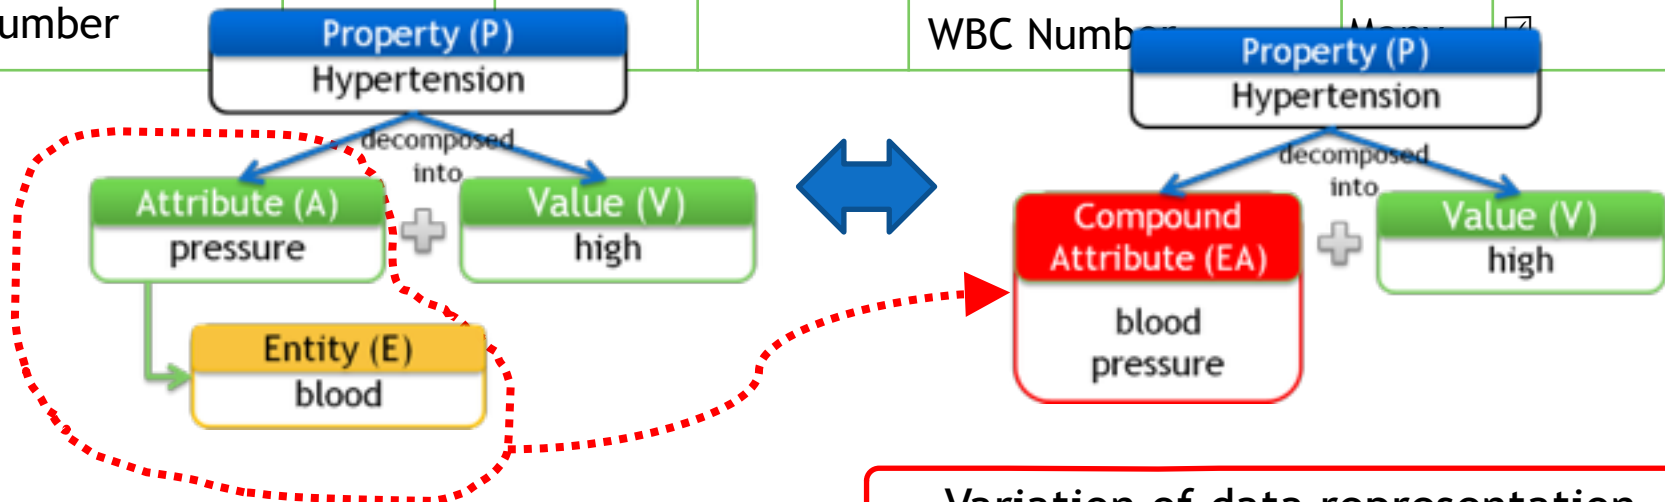

# Ontology of Property/Quality

- p **BFO** =  $\langle E, P \rangle$ -based
- p **DOLCE** =  $\langle E, A, V \rangle$ -based
- p **YAMATO** = Integration of both and realizes interoperability between them

# Representation of abnormal states

Abnormal states		E	Se	A	V	Solved
Nausea	EAV	Human		Nausea (non-decomposable)		<input checked="" type="checkbox"/>
Chest pain	ESeAV	Human	Chest	Pain (non-decomposable)		<input checked="" type="checkbox"/>
Arterial stenosis	EAV	Artery		Cross-section Area	Small	
Hypertension	EAV	Blood		Pressure	High	
	EA,V			Blood pressure	High	<input type="checkbox"/>
Hyperglycemia	ESeAV	Blood	Glucose	Concentration	High	<input checked="" type="checkbox"/>
	ESeA,V			Blood Glucose Level	High	<input checked="" type="checkbox"/>
Increased WBC number	ESeAV	Blood	WBC	Number	Many	<input checked="" type="checkbox"/>
				WBC Number	Many	<input checked="" type="checkbox"/>

Compound attribute

Variation of data representation

# Is-a hierarchy of abnormal state ontology-1

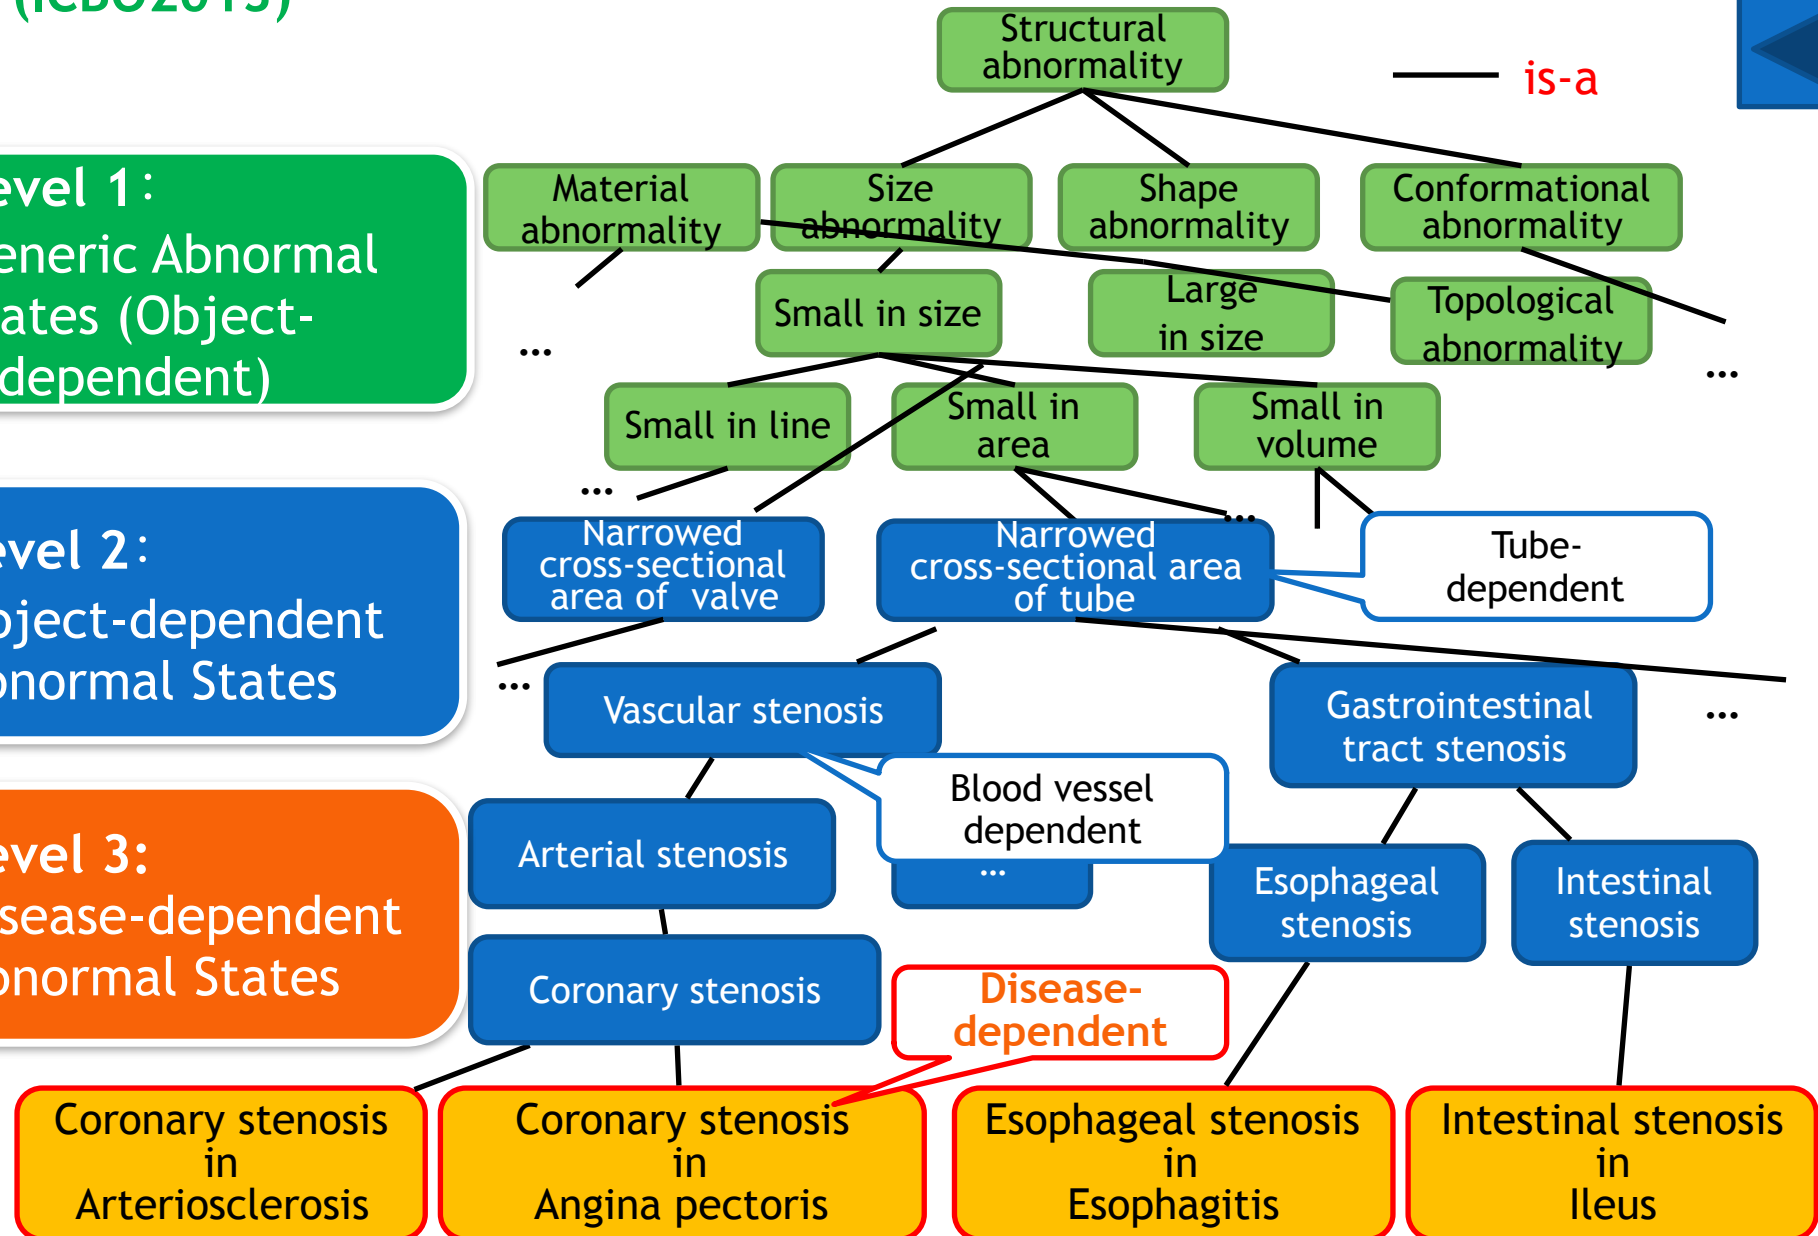

(ICBO2013)

**Level 1:**  
Generic Abnormal  
States (Object-  
independent)

**Level 2:**  
Object-dependent  
Abnormal States

**Level 3:**  
Disease-dependent  
Abnormal States

# Abnormality

- p We don't go into philosophical discussion about what is abnormal
- p We consider any states *referred to in definitions of diseases* as abnormal states

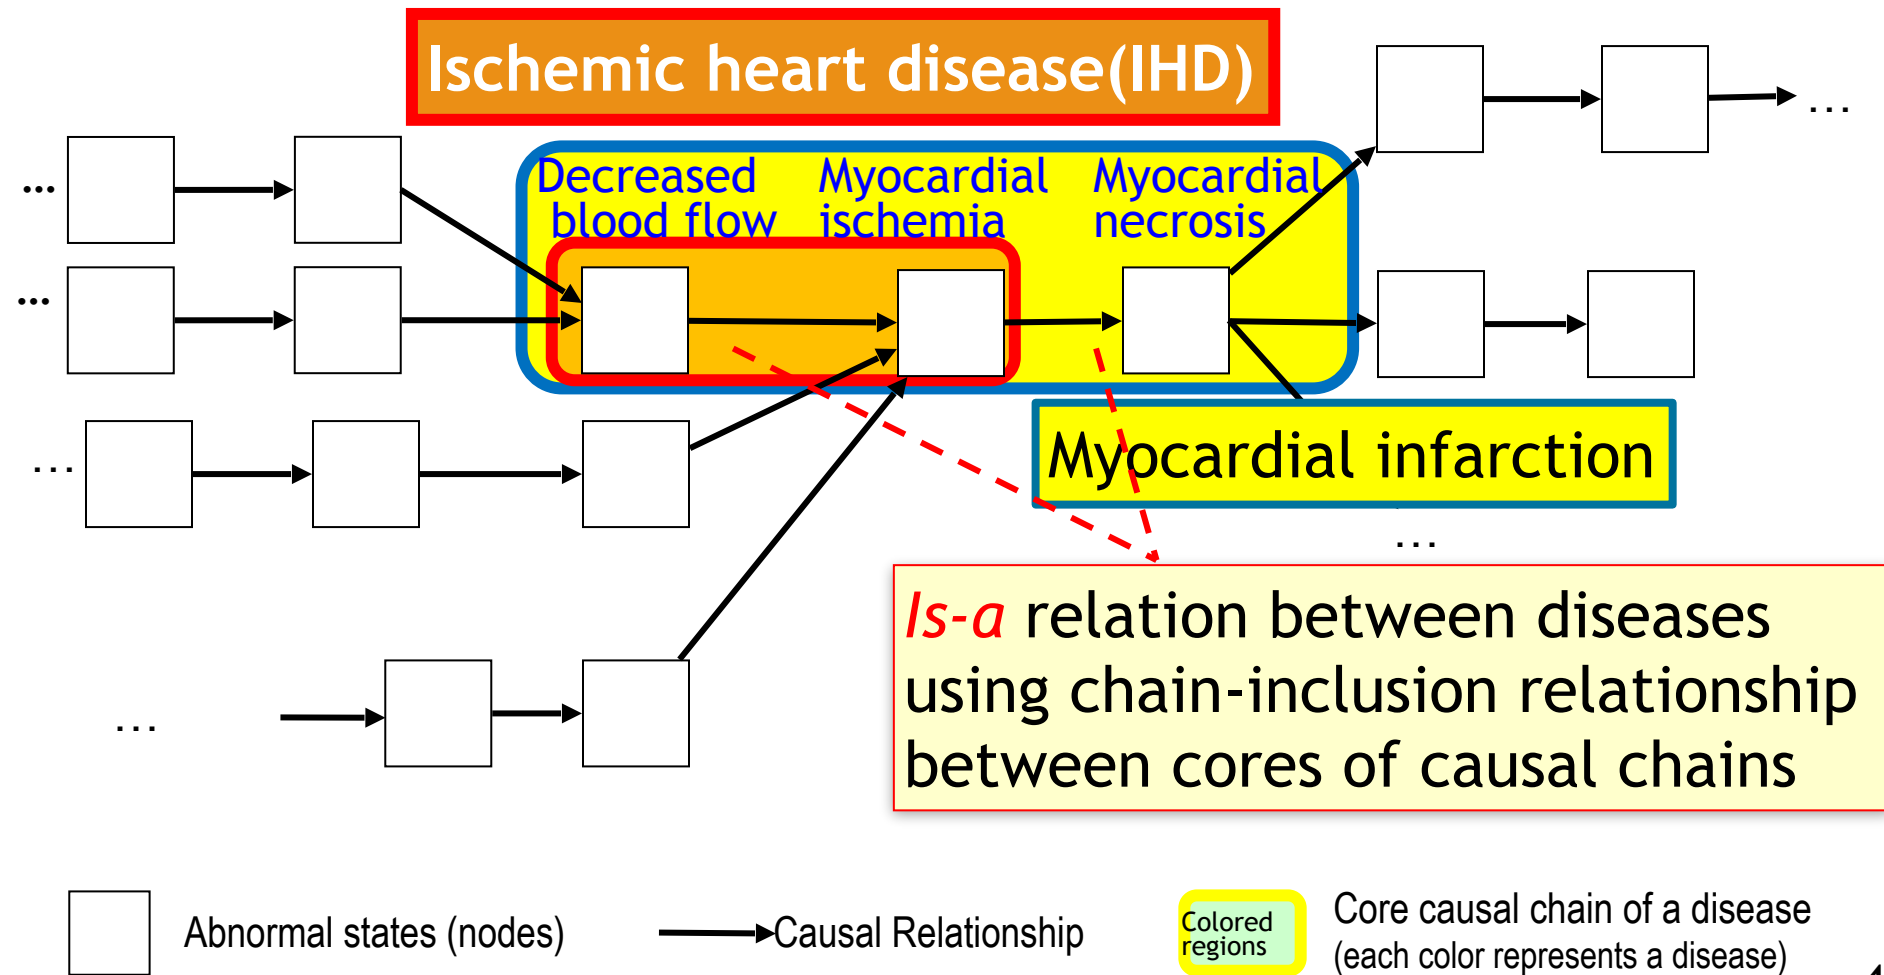

# What is a disease?

- p Abnormal state?
- p Disposition?
  - p *A disease is a disposition (i) to undergo pathological processes that (ii) exist in an organism because of one or more disorders in that organism (excerpt from OGMS paper)*
  - p *A disposition has manifestation which corresponds to disease course*
- p Causal chain of abnormal states?

# An Example of Causal Chains of Ischemic heart disease in RFM (ICBO2012)

- A disease is constituted of one or more causal chains of disorders (abnormal states)

# A disease is not an abnormal state

- p A disease is constituted of (causal chains of) abnormal states
- p A disease is a **whole** whose **constituents** are abnormal states
- p Even if a disease is defined in terms of one abnormal state, it doesn't mean the disease and the abnormal state is equivalent

# Problems and solutions in linking data

# Problem 1

## Granularity of concepts to be linked

PATO: generic properties  
e.g., decreased size,  
increased pressure,  
etc.

# No existing ontologies can resolve this problem

Various categories are mixed up:

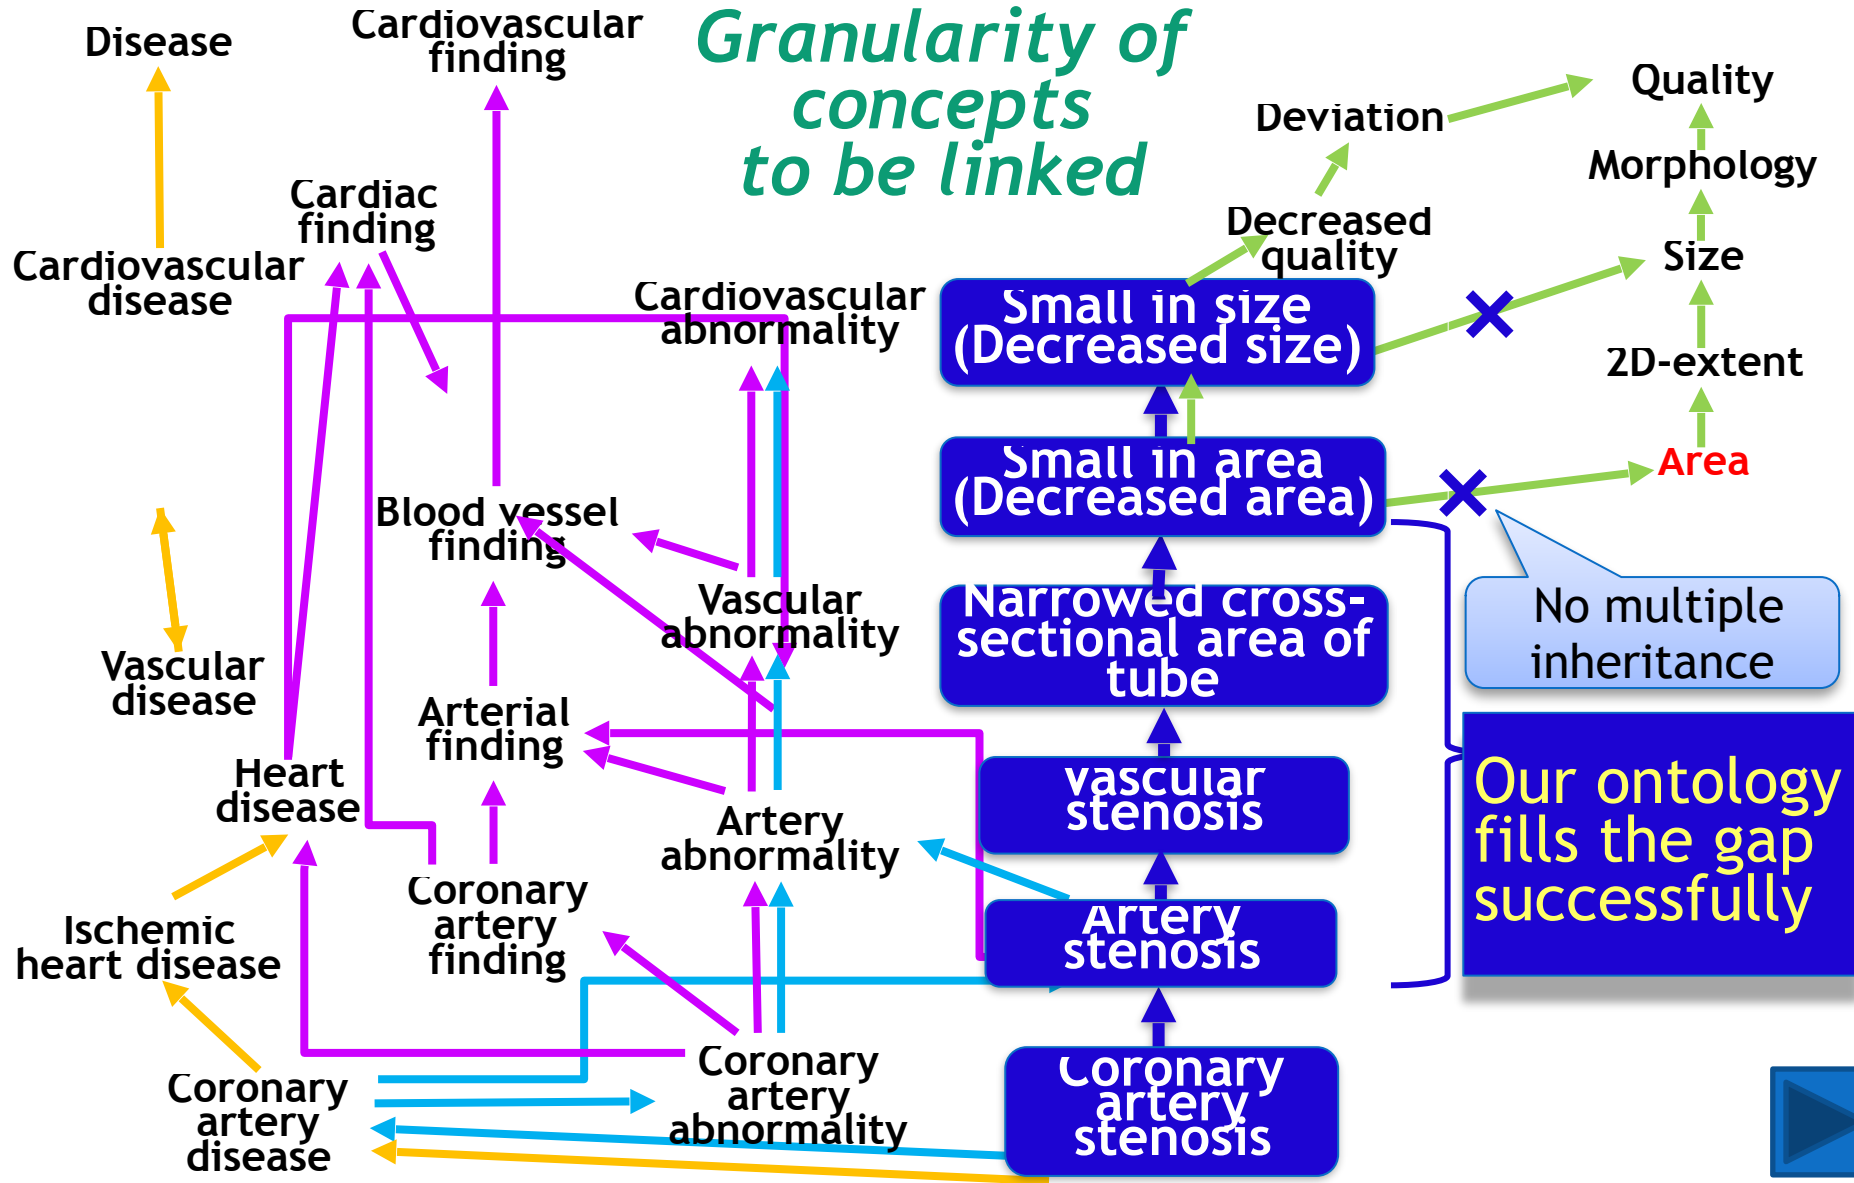

*e.g. Findings, Diseases, abnormal states...*

Multiple inheritance

→ hard to understand the intrinsic nature of concepts

# Problem 1

## Granularity of concepts to be linked

## Problem 2 Abnormal states vs. Diseases

Abnormal state *is-a* Disease

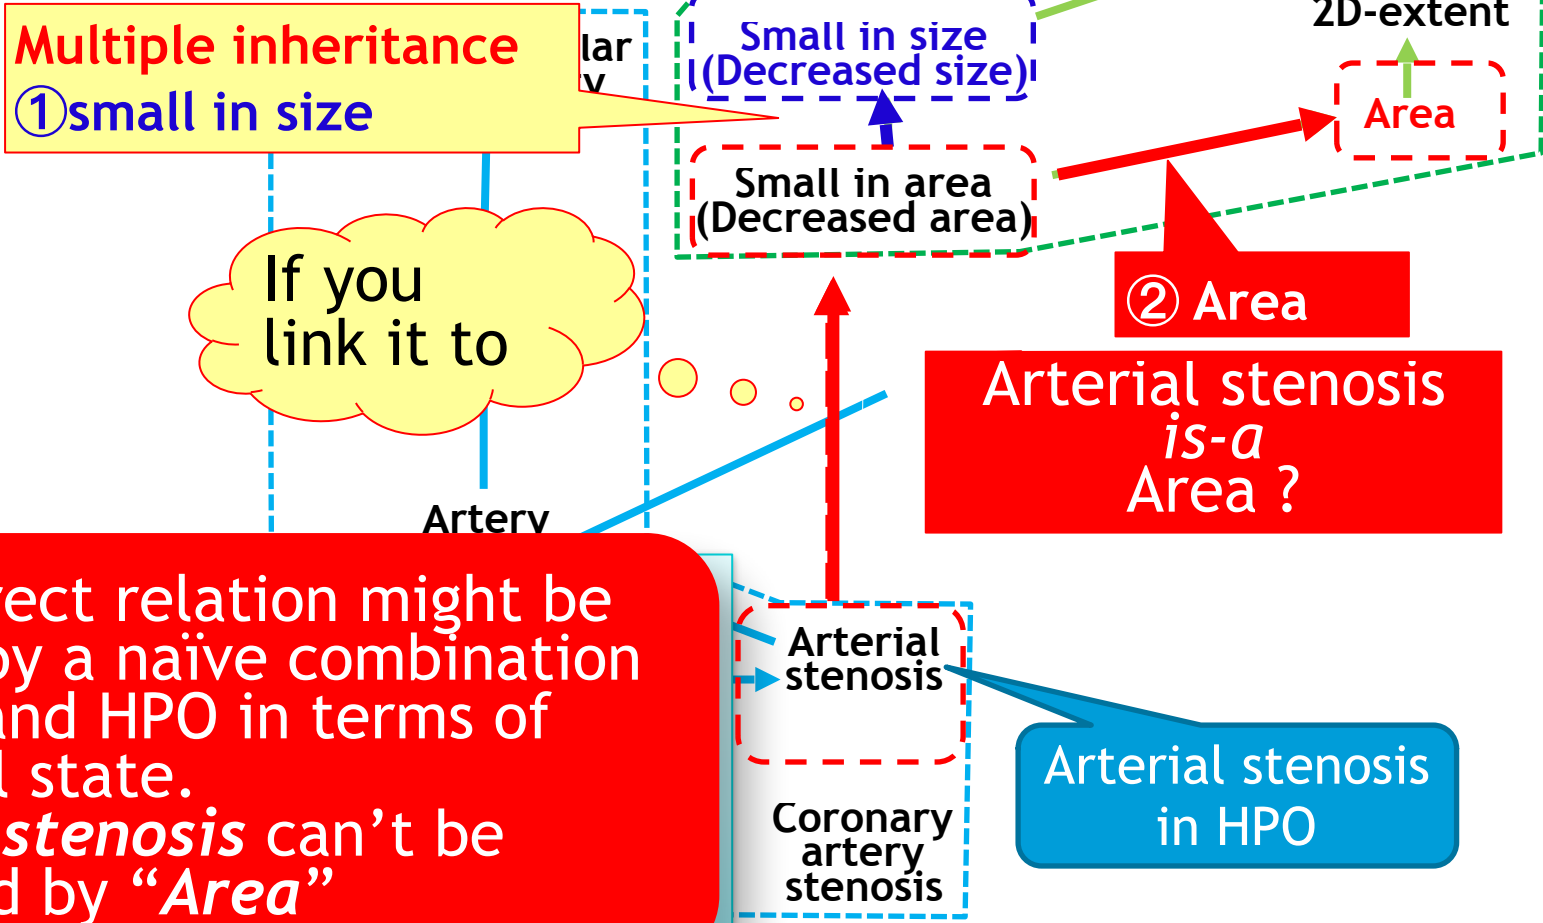

Disease *is-a* Abnormal state ?

→ hard to understand whether the term is Disease or Abnormal state

① **Coronary artery stenosis** *is-a* **Coronary artery disease**

**Problem 3**  
*No distinction between  
Property(P) and Attribute(A)*

- An incorrect relation might be derived by a naïve combination of PATO and HPO in terms of abnormal state.
- *Arterial stenosis* can't be subsumed by “*Area*”

is-a relation  
→ PATO; → HPO

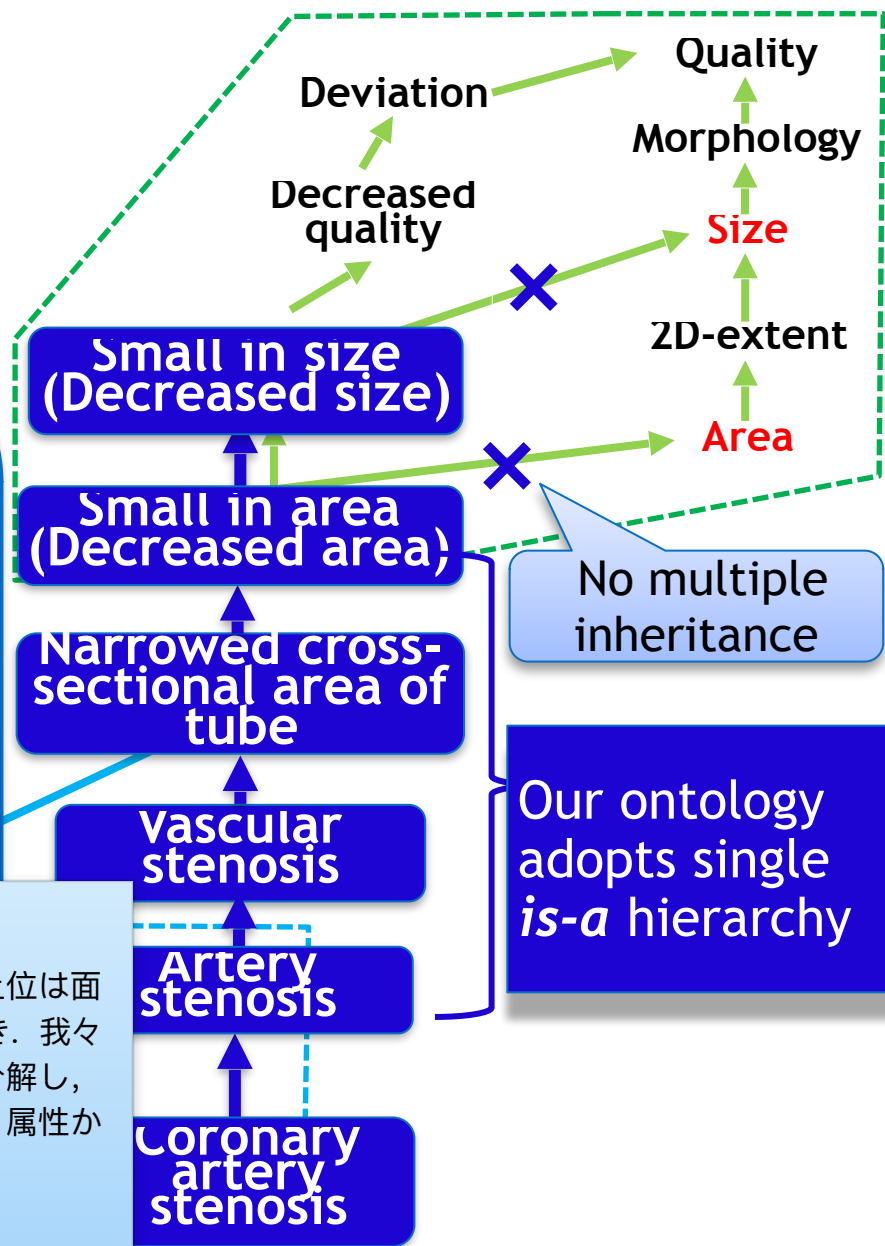

**Problem 3**  
*No distinction between  
Property(P) and Attribute(A)*

Abnormality Ontology based on  
**single is-a hierarchy**

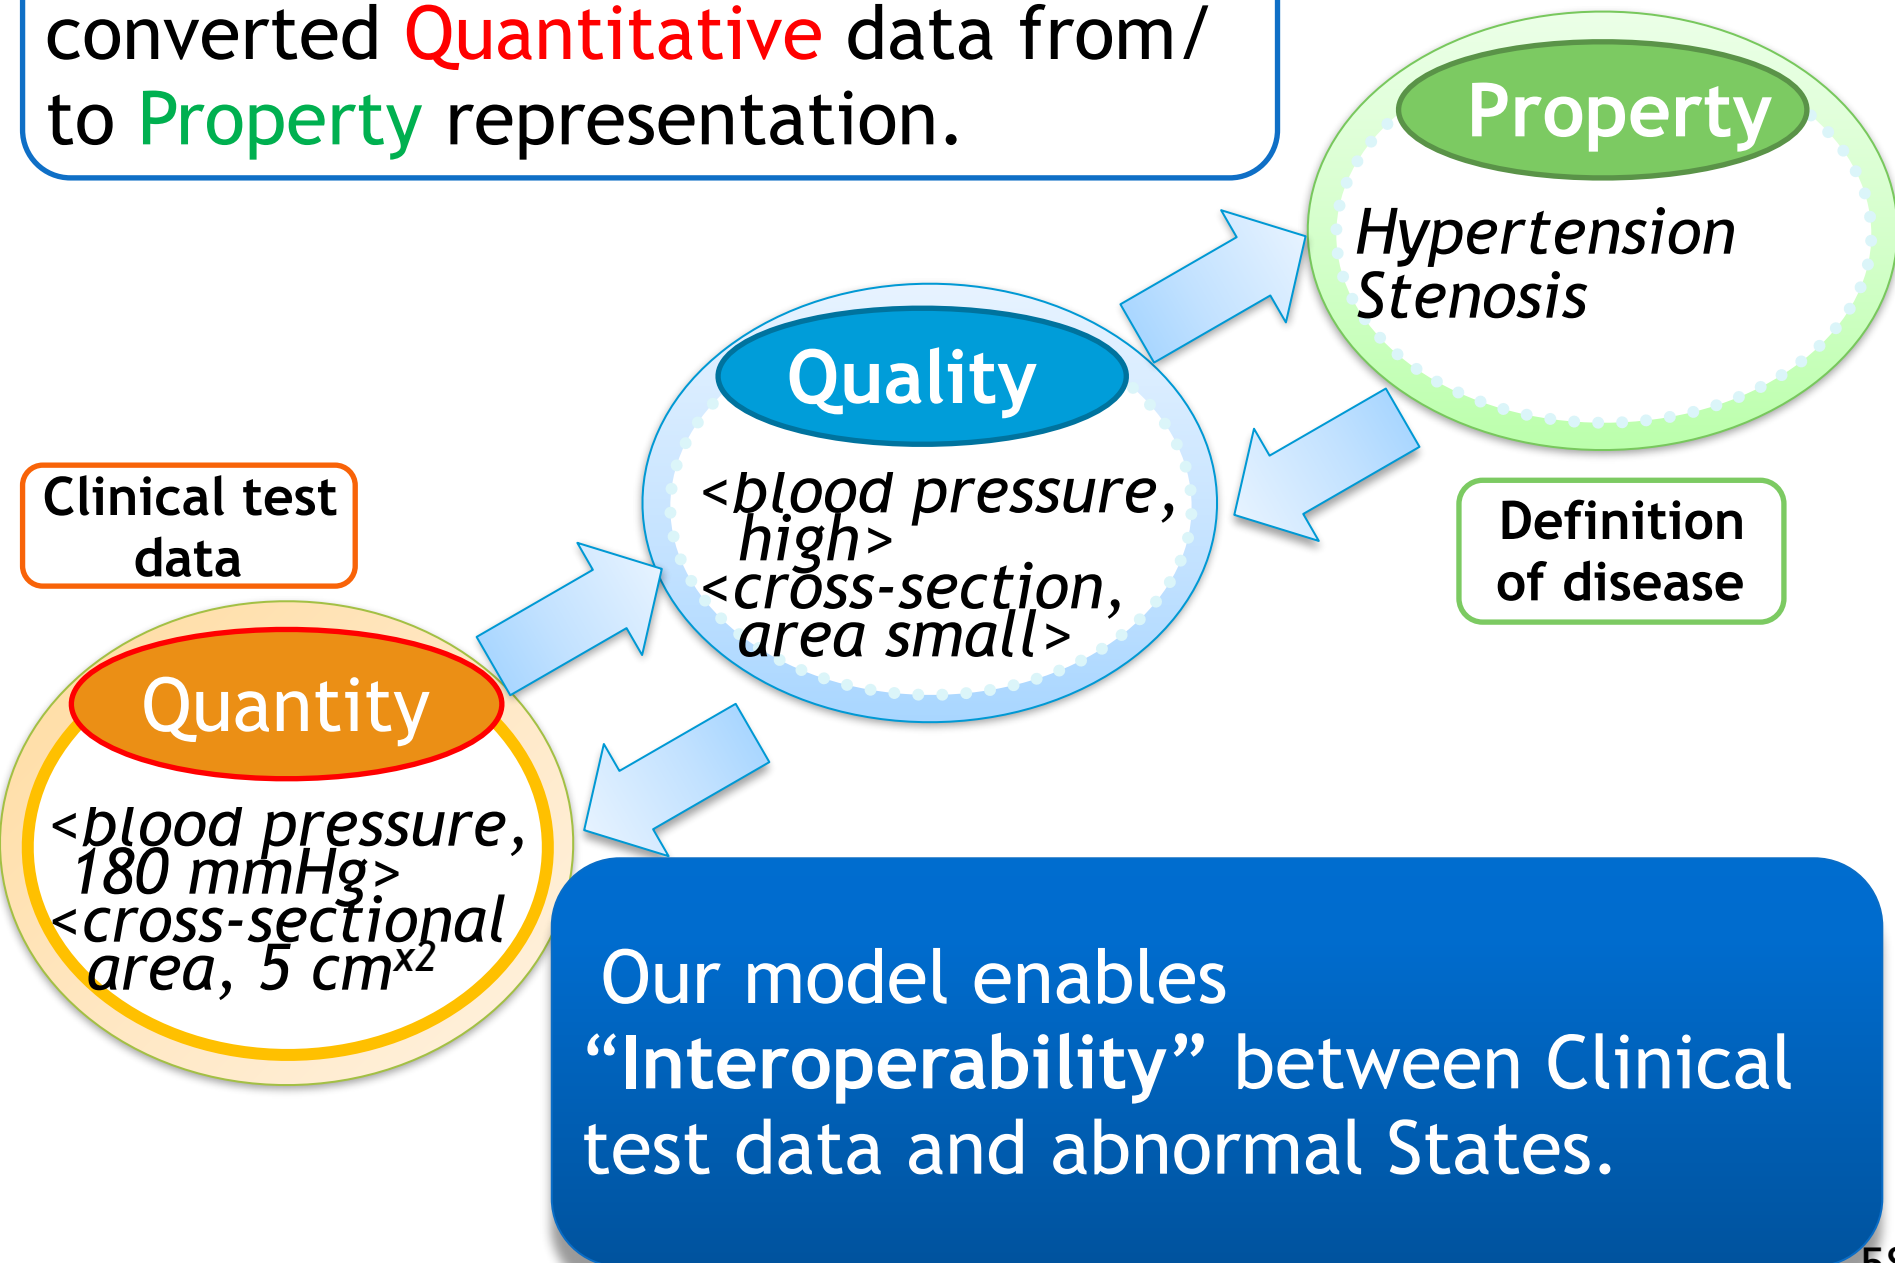

- The proper *upper class* of “Small in area” should be “**Small in size (P) <size(A), small (V)>**” rather than **area (A)**.
- Clear distinction between diseases and abnormal states
- Our model differs (P) and Attribute (A)  
P =def <A, V>
- An engineering issue of state

異常状態で考えた場合、狭窄の上位は面積（属性）ではなく、特性とすべき。我々の基本方針では、特性を属性に分解し、特性と属性を区別しているから、属性が

is-a relation  
→ PATO; → HPO; → Ontology of Abnormal States

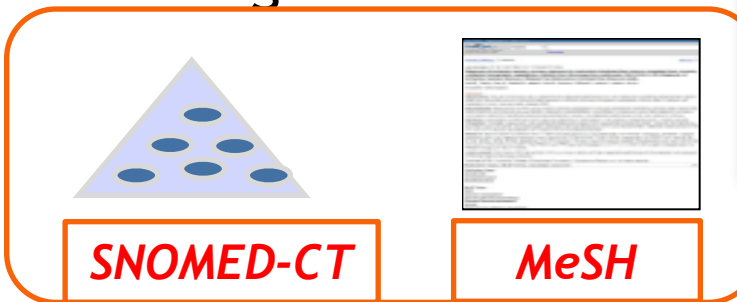

Qualitative representation can be converted Quantitative data from/ to Property representation.

Linking our ontology as a **hub** of existing resources will bring benefits:

SNOMEDの下に隠れています。利点  
Linking our ontology as a hub of existing resources will bring benefits:  
• Complement knowledge levels

# Concluding remarks

- p **Ontology is important as a sense-making technology**
- p Light-weight ontologies work well for LD/LOD of common sense or daily life domains for **making sense of data**
- p A lot of vocabularies are already available
- p You would need heavy-weight ontologies for LD/LOD in special domains for **making sense of concepts**
- p Such data are not interoperable and require a careful analyses of the ontological assumptions
- p Heavy-weight (philosophy-oriented) ontologies contribute to such cases

**Thank you!**

# 語彙

- contraction, stricture (狭窄)
- *stricture* of the esophagus (食道狭窄)
- angiostenosis, vascular constriction (血管狭窄)

# Entity stacking

an amount of clay **vs.** a vase

- They are different entities
- Two entities can't share a spatiotemporal region.
- How can they exist?

# Why roles?
